

MAJOR PROMPTS USED

1. suggest me what i can do uniquely
2. ok then lets go with track 1 , tell me in more detail what i have to do
3. what is water,luxary and compact score for?
4. so finally on what basis this recommender system is being made
5. but this code really is a nested for loops giving $O(n^4)$ straight
6. ok lets optimize and drop the idea of $O(n^4)$
7. why are you changing current logic, cant we create a dataset so our current logic atleast the same
8. but now we have to change recommender.py according to data and calculate our water and the other one score column....see take a look at data set and recommender.py there are issues
9. do that and one more thing, for luxury score i think we should make some rules and according to that fill the luxury_score col
10. u may suggest , i am thinking of free gemini api 3.1 flash lite
11. why gemini sdk cant we work on openai() client?
12. cant we use gradio
13. i have one more idea lets save currentt app.py as test.py if we want in future to teest the connection between all 3 of them
14. hey check if this recommender is correct
15. there is a bug , if desired_style did not get entered it aint giving any recommendation, how may i correct it?
16. Should I give user option , give them button to customise or give themm option to write their specification in the chat?
17. does python automatically gives international system value thats why we added this fxn?
18. what is the logic behind selectng "Best overall"
19. lets start making 2d layout for user choice
20. still not solving , hey first check there was an issue with files check iif everything is alright wwhat we have done until now
21. give code for door improvement
22. one more suggestion, can we make generate layout button appear only after we click generate recomendation, also make word written iin ui more like it is being user freindly there are many technical terms written there like natural language etc.
23. but in this data almost all dimensions are missing,why?
24. now that we have found dimesnsions, water_usage is missing which is an important metric , what to do?
25. can we use imputation techniques to fill remaining missing data?
26. one final thing i want to cnf, this primitive file of 77 rows , all info are trustified?

27. After doing out dataset work, later on can i change everything from recommender.py acc to dataset, that's best, what i am saying is we should make according to dataset not dataset according to code
28. i think there are many problems in this dataset like missing vals of k039 040,074-077, and almost all confidence score are 1, is the model so sure about that?

WORK-FLOW (DFD)
